Give me a command panel ~~to~~ command code to extract the all the column name. & Save it in notepad txt file.

Give me a command panel (CLI) command code to extract all the column name including their filtered attributes. Except the following column -

create a claude project - name data mapping & normalization.

Attach - ① VDOT full txt with colⁿ name & attributes as the standard frontend data structure that Crash Lens will expect. ② VDOT data dic

→ when user will provide the target state full txt file with colⁿ name & attributes along with their data dictionary, the claude project should produce

→ Ask for data dictionary / search internate to find it.

- ① a PDF file with target state Data column & attribute to map with VDOT data column & attribute mapping.

Remember all attributes can't be mapped. User will provide which attributes needs to map & which optional.

- Physical Juris, Functional class, Ownership are required & mandatory to be mapped.

- ② a HTML file showing the target state data column & attribute map with VDOT data column & attribute mapping. Give user to change the data column & attribute from dropdown menu. It should be saved in localstorage or indexdD & can be print in PDF for further investigation. Show some statistics for user understand.

③ ~~Fo~~ In order to match / fill up with VDOT standard data colⁿ & attributes. if a target state miss some colⁿ data, find a strategy to fill up & provide claude code prompt for data validation step. Ex. if target state doesn't have

→ Documen number - come with a naming convention & follow that

→ Route name - use OSM nominative strategy to reverse GPS to get Route name & intersection node #.

→ ~~Ex~~ Suggest users what colⁿ are missing & how/ what strategy we can follow to fill up the gap.
