Normalization & Ranking validation step:

1) Target is to create a HTML file to test it similar to existing crash validation engine iframe HTML. However to use existing validation engine remove - 4 road types with statewide gzip from R2 storage {state}_state_...gzip file. Except that keep everything including logic save back to R2 Storage & etc.

2) ~~Cur~~ Keep current crash validation engine untouched. Don't remove anything.

3) Normalization step:

(A) I will provide current frontend VDOT expected data structure. Make that structure as a golden standard tempatate.

(B) I will keep state specific data architecture in the states/{state} folder as {state}_Abbreviation ~~normalization.txt~~ normalization.py file such as Delaware de_normalizion.py.

Scanned with CamScanner

ⓒ Your task is to following the target {StateAbreviation}_normalization.py & frontend expected data architecture normalized the {State}_state_gzip file.

ⓓ Also provide some statistics or something that i can know ~~wh~~ how many col^n mapped & how many remain. Also in the HTML show the target state & front end data col^n map so that if user wants to change, the can chang the mapping & it will be permanent rules after that until it change by manually.

④ Ranking validation step -

Ⓐ I will provide the prompt

Ⓑ You will find all the jurisdiction specific jason file inside states/geography folder

⑤ After doing normalization & Ranking validation along with

Scanned with CamScanner

other steps, save it to R2.

(6) Give me the HTML to test it. Ultimatly I will ~~in~~ include it pipeline yml & batch pipeline yml as a standard.

(7) Ask me if you want more clarification
