Inventory Downloader –

currently it downloads selected jurisdiction from upload tab - which is correct & don't touch current configuration.

Enhancement: I want to add a function button called "Statewide Download" with a checkbox to unlock the button. the check box will warn users that it may take an unexpected longer time to complete the entire state. Please make sure this window tab is keep open. Meanwhile you can use other tabs."

Logic this new enhanced button will run a loop. currently the existing set up download one jurisdiction/ county. For a state of 134 counties (Ex. virginia), the button will do one by one county download until it reach all the county.

currently, after download the tool automatically push to R2 Storage with respective jurisdiction folder. For the new enhancement follow the same. Therefore, one shot 134 jurisdiction will have Traffic inventory csv file.

R2 worker: Can we set up an worker that will add individual jurisdiction Traffic inventory csv file to One Traffic inventory csv file & store it in the respective state statewide folder? Also currently in the Inventory Manager Tab user is able to modify their respective jurisdiction inventory csv file. R2 worker should also add those & save it in the statewide folder. Recommend your approach.
