R_2 - storage update

Question: can we do same download workflow that Github action does in the cloudflare R_2 so that it will download process & store data in R_2 storage? Is it feasible?

Scanned with CamScanner

Main focus - Github action workflow has limited time & storage since data will continuously grow every month. Transfering cloudflare R2 will it solve that scalling issues?

For debugging purpose for each state we will do Github, once it successful, can we transfer the workflow to R2?

3 After splitting phase, can we trigger the ~~vat~~ crash validation engine automatically so that validated data will go for forecast phase.

Scanned with CamScanner

4. Since data will grow if we consider State, regions, mpo, to provide best data loading to the frontend do you recommend to ~~transfer~~ connect R2 → pulic data link → Supabase ?

R2
↓
public url for
State, Regions, mpo, county
↓
Supabase
↓
Based on user profile
& State, jurisdiction
↓
Frontend will
fetch the data

Question: Instead of different scope (State, Regions, mpo, county), do you recommend to store state R2 url to supabase & from

Scanned with CamScanner

there sql query to Regions, MPO, county ?

5. In the R2 storage if we think multi-state data public url → after normalization & validation → it will be same database. Do you think we can merge all the state datalse to the supabase, after validation ? will it be a productive for 50 states.

6. currently Delware state dont have Road name or node number. Do you think we can use OSM road segment & node & match GPS coordinate to come with a soln ? Do you think we should add it as a critiera in the crash validation engine?

Scanned with CamScanner

Goal is to make a unified crash validation engine with enough criteria that will cover all states needs? Recommend me.

7. if I host supabase in Hostinger & after all the database programming, can i download it & transfer in it AWS server in future. Will you recommend to host supabase in AWS instead of hostinger,

8. I want to use Openclaw/ Moltbot to set up cloudflare, supabase etc. Is this possible?

9. Do you think we can use cloud flare storage & connect data to supabase for sql query?

Scanned with CamScanner

10. I want to create skills for cloudflare R2 to do all the 1 to 9 steps. Claude chat has cloudflare R2 connector & supabase connector. Do you recommend use claude chat for that? or claude code also has those connectors? since claude code is connected with github repo. it will be more efficient.

11 I want to create a claude project ~~with~~ & in Knowledge base I will provide virginia crash data csv sample. This project will help me when I name a state it will search the api endpoint that works & download data & data dictionary

Scanned with CamScanner

& then check the data structure.
then make a mapping for
data normalization consider
virginia data is the standard.
After that it will write a
claude code prompt so that
it will implent the coding
& data normalization in the
github repo. For the verification
the project will also create
a html with the active api
point with map show the
data & data mapping.
