① Map Tab -

currently Asset layer has -

Traffic inventory (TI)

Fed Data layer (BTS)

Ⓐ When user draw polygon/circle to a location to extract crash data, currently in the bbox functions we don't include TI & BTS data. Create a separate function that will take TI & BTS data when user draw polygon/circle to a location. This function should bring selected location

- TI & BTS data

Ⓑ In the PDF export report (after polygon/circle so draw), currently it shows on crash data analysis. Bring TI & BTS data using the function that we made & Add it in the PDF report at the end so that user can find location context such as speed limit.

Regulatory signs, warning signs, Traffic signal nearby school if any (consider a range ~~1000~~ 500 ft to 2000 ft radius), Bridge if any, railroad crossing, Transit stope, Transit routes, AADT road network etc. Most important is posted speed limit. Do you think we should use mapbox driver direction api to get the road center line to pick up the speed limit from the TI ? we already have mapbox. consider if needed.

C currently Map Tab - Asset layer. user have to turn ON/off to see the data in the map. Do you recommend, when user select draw polygon / circle option, these TI & BTS layer will be turned on & capture the data & after

that the layer will be turned off. what's the best way? Recommend.

D Map tab- Asset layer-
I tried to add the speed limit layer under TI similar to the Inventory manager tab. However, I failed multiple times. check Inventory manager tab & see how it brings the speed limit data including icons for each speed limit such as 25 mph for 25 mph speed limit icon, 35 mph for 35 mph & so on.

Also Asset layer- Traffic inventory some features are auto turn off & display as zero. However Inventory manager show their.

Scanned with CamScanner

actual icons & signs number.
Follow Inventory Manager & bring that data.

E Asset layer- Traffic Inventory- it should be jurisdiction agnostics. All the csv TI is saved in R2 storge. check Inventory manager tab & see how it connect R2 to bring jurisdiction specific data. Use that Inventory manager logic to bring & connect the appropiriate data source. Remember jurisdiction agnostics from upload Data Tab jurisdiction selection.
