Manual_{state}_trigger_dowr

~~Downloo~~ {State}_Manual_download:

Currently, user download crash data from state website either by API or playwright & then normalize it. I want an alternative approach (don't touch current jurisdiction specific download method), ~~to download~~ Ex. user can manually upload the crash data in the ~~ser~~ corresponding R2 storage & then run manually the github workflow {State}_manual_download yml, which will take the file from R2 & normalize it & then trigger pipeline yml or batch-pipeline yml file to further process it. ~~It will~~ This workflow will not be scheduled & run

Scanned with CamScanner

as needed basis. User can trigger it to quickly check everything working & then move for automation later.

Make the {state}_ manual_download state/jurisdiction specific following the current Batch All jurisdiction yml or Download_{State}_crash data yml.

R2 Storage
