1. Add Excalidraw connectors & update .claude.Md file to draw diagram for normalization & splitting for a new State onboarding

2. Add a layer after normalization step - called Ranking validation.
In the upload data tab - View level - Region view & MPO view have drop down with respective counties.
Find the appropriate file where we defined that region & mpo drop down & their respective counties. Possibly ~~hiercly~~ hierarchy. jason file.

~~Reco~~ This Ranking validation ~~wi~~ Step will perform some steps such as - ① similar to VDOT District column it will add a {State} District column & based on the Physical Juris Name

Scanned with CamScanner

(4) In the Ranking validation step - based on the Physical Juris Name column, we will add - {state} District column, Planning District, MPO Name column if a state dataset is missing these column by observing states hierarchy jason. After that this step will add some column for ranking in the normalized data -

(i) District Rank

(ii) Physical Juris Rank

(iii) Planning District Rank

(iv) MPO Rank

These additional column will actually rank respect District, Physical Juris, Planning District, MPO in their respective column based on total crash #, total ped crash #, total fatal #, total fatal & serious injury # total Bike crash.

Scanned with CamScanner

Therefore 4x5 = 20 column will be created in this step.

Ex: District Rank - total - crash

District Rank - total - Ped - crash
- total - Bike - crash
- total - fatal
- total - fatal - serious injury

After that it will save in the R2 as shown excalidraw step 4

→ This Ranking validation step will do create the 4 major column & fill it based on that state specific hierarchy jason files (if a state data missed it)

→ Rank these column coln & create 20 column of ranking.

Scanned with CamScanner
