We have 50 states & their jurisdiction counties / town / cities. We have 4 Road types - county only for county Rd
- city / town only for city / town Rd
- All Roads (no interstate) -
- All Roads (including interstate)

Your task is to create a default road types selection for jurisdiction specific. Ex. Henrico county VA does not have city Rd. therefore ~~defau~~ they maintain their own rd system. Therefore, when user select Henrico county default view county Rd. in the jurisdiction drop down we have list of city & town. For selected city default will be city / Town Rd only view.

Scanned with CamScanner

Ex. City of Richmond - they don't have county Rd. Therefore their default view is city / ~~Rd~~ town Rd only.

Similar for town - default is city / town Rd only.

If a jurisdiction doesn't maintain ~~their~~ rd & State maintain it, then default view will be All Roads (no interstate).

~~If~~ Above All, if R2 Storage has zero data for a certain Rd types, then All Roads (no interstate) will be default.

~~If All Roads (no~~ Ex. a jurisdiction ~~doesn't~~ ~~main~~ doesn't have crash data for county / city Rd types then default. All Rd (no interstate)
